

# Criterion E: Evaluation

## **Evaluation of the product:**

As a person who created this program, I am happy with the results, but it does not mean that the program does not have its faults. As far as a success criteria are concerned stated in the Criterion A, the one that has been completed are:

- Client can create user accounts

- Program can scan the barcode of the product

- The program can search the database and display the ongoing transactions on history

- The program can count the daily sum of money and compare it with the expected one.

- The program must have user-friendly interface, which is not complicated

But the criteria that has not been met are:

- The program can print the receipt - this task was too complicated for my knowledge of programming

- The program can track the amount of stock - the fundamentals for that are implemented into the code, but I did not manage to fulfil it

- The program can create documents using templates, such as daily transactions report - his task was too complicated for my knowledge of programming

## **What can be done better:**

I would implement all of the thing from success criteria that has not been met.

## **Client feedback:**

He was very pleased with the outcome of the application. He liked the user interface and the option of counting the daily money report I consulted with him further improvements to fulfil every success criteria.
